5

TITLE:      ELECTRONIC APPARATUS

10

DESCRIPTION

15

TECHNICAL FIELD

The invention relates to electronic or electrical apparatus (hereinafter 'electronic apparatus' in the following description and claims) incorporating a  
20 loudspeaker, more particularly a bending wave panel loudspeaker, e.g. of the kind described in WO97/09842.

BACKGROUND ART

Loudspeakers as described in WO97/09842 are known as  
25 distributed mode, or DM, loudspeakers and it is also known from WO97/09842 to teach the incorporation of bending wave panel loudspeakers in electronic apparatus such as portable compact-disc players, laptop computers, musical instruments

and vending machines etc.

It is an object of the invention to enhance the functionality of electronic apparatus incorporating a bending wave loudspeaker to enable direct user input, e.g. to control or operate the electronic apparatus. Such apparatus may be of widely different kinds, e.g. cellular telephones, vending machines, domestic appliances etc.

#### DISCLOSURE OF INVENTION

10 According to the invention, there is provided electronic apparatus incorporating a loudspeaker, wherein the loudspeaker comprises a bending wave panel member having a user-accessible surface, a vibration exciter on the panel member to introduce bending wave energy into the  
15 panel member in response to an electrical signal applied thereto, and at least one touch sensitive area on or associated with the said user-accessible surface and responsive to user contact. Thus the user responsive means may act as a touch control means, e.g. whereby the user can  
20 enter instructions or provide information or otherwise control the use of the electronic equipment.

Preferably the panel member has the capability to sustain and propagate input vibrational energy by a plurality of resonant bending wave modes in at least one  
25 operative area extending transversely of thickness, wherein the frequencies of resonant bending wave modes are interleaved in a predetermined frequency range so that resonant bending wave modes are substantially evenly

distributed in frequency and wherein the vibration exciter is mounted on said operative area of the panel member, at a preferential location or site for coupling to the resonant bending wave modes, to vibrate the panel member and excite  
5 said resonant bending wave modes in the panel member, the resonant bending wave modes in turn producing an acoustic output.

Thus for example the loudspeaker may form a control panel, e.g. for operating a vending machine of the kind  
10 described in WO97/09842. The invention is thus applicable to any electronic apparatus incorporating a bending wave speaker panel where a person is able to touch a portion of the panel surface, and may comprise pads or areas or switches or buttons which provide a means for instructions  
15 or information to be entered to the electronic apparatus. Pressure switches may also be attached to the panel surface or embedded within the bending wave panel.

The speaker panel may incorporate other methods for presence sensing, including matrices of photodiodes and/or  
20 photocells round the perimeter of the panel and which sense the position, e.g. of a finger directed at a point on the panel. Where metallised contacts are used these may be of the metal oxide film or thin metal film type.

Applications include touch screen control for  
25 translucent display and lighting bending wave panel speakers, and for automated ticket machine (ATM) and vending machine applications. Many other categories are indicated for example in consumer electronics such as a

speaking or sound informing touch panel for a remote control unit, whether illuminated or not. The inventive concept may be applied to a mobile telephone display of suitable area e.g. to combine a display, a loudspeaker and  
5 a control panel with illumination.

User feedback of control settings via the speaker panel with incorporated switch buttons would find utility in the control sections of hi-fi and audio equipment, particularly where complex setting up is required for  
10 example in home theatre systems. Also domestic appliances, e.g. dishwashers, and clothes washing machines would benefit from the addition of this technology, as would industrial instrumentation, display orientated instructions such as analysers and oscilloscopes. The invention could  
15 be applied to laptop and other computer controls, points of sales data systems, personal, stock control and labelling devices, and also to automotive navigation units, automotive dashboard displays with a bending wave panel speaker, point of sale products with sound output and  
20 facility for user/customer data entry or control of operational information, and similarly for educational display units for museums, zoos etc, including interactive audio visual devices.

25

#### BRIEF DESCRIPTION OF DRAWINGS

The invention is diagrammatically illustrated, by way of example, in the accompanying drawing which is a perceptive view showing a vending machine incorporating a bending wave

panel loudspeaker/touch pad.

BEST MODE FOR CARRYING OUT THE INVENTION

In the drawing there is shown a vending machine or ATM  
5 (1) comprising a generally rectangular cabinet (3) having  
an inclined front face (10) carrying a control panel (2)  
and a delivery chute (4) for dispensed articles below the  
control panel (2).

The control panel (2) is in the form of a generally  
10 rectangular resonant bending wave panel speaker (5) of the  
general kind described in WO97/09842 and which is excited  
by a vibration exciter (9) mounted on the inner face of the  
panel speaker (5) so as not to be visible externally. The  
speaker panel is supported in a suspension (7), which could  
15 be resilient or clamped, supported in the front face (10)  
of the cabinet.

The visible face of the control panel/speaker is  
printed with information (6) as to nature of the articles  
or products to be dispensed and the information has  
20 associated therewith touch sensitive panels (8) so that a  
purchaser can input an instruction by manual contact with  
the panels (8) in a manner known per se. The instructions  
can be confirmed and/or information can be reinforced by an  
audio output from the machine (1) delivered by the speaker  
25 (5). It will be appreciated that the machine will require  
associated electronic equipment to replay stored audio  
messages and to receive input information from the touch  
pads, but such electronic equipment is generally

conventional.

This unique combination is possible because in contrast to the fragile cone of a conventional speaker, which may be easily damaged by finger contact, and would not sustain the finger pressures of reliable touch pad actuation, a bending panel speaker is tough, indeed may be made of vandal proof materials and is relatively unaffected by finger contact. Thus the panel which forms the interface to the user/customer is an integration of speaker and user data entry at the point of input and the speaker can provide verbal reply to the data entered in addition to leading the user through the usual questions associated with a sale.

The touch pads may have a surface embossing or similar so that persons of impaired sight may use the keyboard represented by the touch pads and be helped by the relevant audio feedback from the speaker/touch pads and be helped by the relevant audio feedback from the speaker/touch pad device.

Evidently other applications for the device may be found for the control panels of many appliances such as washing machines, toasters etc. room thermostats sound and light controllers, burglar alarm control panels. Also automotive controls panels where the speaker device may also be an integral part of trim or constructional parts such as the dashboard.

The touch sensing may be capacitative or pressure sensitive via thin laminated films, or be micro reflex

switches, or by paired and/or interdigitated conductive regions.

INDUSTRIAL APPLICABILITY

- 5       The invention thus provides a resonant panel loudspeaker of increased functionality.

CLAIMS

1. Electronic apparatus incorporating a loudspeaker, wherein the loudspeaker comprises a bending wave panel member having a user-accessible surface, an electro-  
5 acoustic vibration exciter on the panel member to introduce bending wave energy into the panel member in response to an electrical signal applied thereto, and at least one touch sensitive area on or associated with the said user-accessible surface and responsive to user contact.
- 10 2. Apparatus according to claim 1, wherein the panel member has the capability to sustain and propagate input vibrational energy by a plurality of resonant bending wave modes in at least one operative area extending transversely of thickness, wherein the frequencies of resonant bending  
15 wave modes are interleaved in a predetermined frequency range so that resonant bending wave modes are substantially evenly distributed in frequency and wherein the vibration exciter is mounted on said operative area of the panel member, at a preferential location or site for coupling to  
20 the resonant bending wave modes, to vibrate the panel member and excite said resonant bending wave modes in the panel member, the resonant bending wave modes in turn producing an acoustic output.
3. Apparatus according to claim 1 or claim 2,  
25 wherein the said at least one touch sensitive area comprises a pad, switch or button which provides a means for instructions or information to be entered.
4. Electronic apparatus according to claim 1 or

claim 2, comprising written instructions on the bending wave panel member and associated with the at least one touch sensitive area.

5. A vending machine comprising a control panel and  
5 a delivery chute for dispensed product, wherein the control panel incorporates a bending wave panel loudspeaker having a user-accessible surface, an electro- acoustic vibration exciter on the panel to introduce bending wave energy into the panel in response to an electrical signal applied  
10 thereto, at least one touch sensitive area on or associated with the said user-accessible surface and responsive to user contact and visible instructions on the panel and associated with the at least one touch sensitive area.

6. A vending machine according to claim 5, wherein  
15 the panel member has the capability to sustain and propagate input vibrational energy by a plurality of resonant bending wave modes in at least one operative area extending transversely of thickness, wherein the frequencies of resonant bending wave modes are interleaved  
20 in a predetermined frequency range so that resonant bending wave modes are substantially evenly distributed in frequency and wherein the vibration exciter is mounted on said operative area of the panel at a preferential location or site for coupling to the resonant bending wave modes, to  
25 vibrate the panel and excite said resonant bending wave modes in the panel, the resonant bending wave modes in turn producing an acoustic output.
